 - Goal of the project
 - Type of Reviews
 - No. of Reviews
 - Review categorization
 - Email Verification

Action Items

- Understanding the legacy algorithms, code and documentation.
- Identify the main functionality of the project.
- Question and answer session with the mentor.

Due Date: 6 February 2020

QUESTIONS TO THE MENTOR

1. What programming languages are suggested for this project?

Python was extensively used by previous semester students who worked on the similar project for Amazon. However, with a quick look at the app development documentation of Shopify, Node.js and react seem to be the go-to languages for this project. Further research by team should conclude the viable programming languages.

2. Is there a requirement specification or a design document for this project?

There is no requirement specification as of now. Need to document one as soon as possible.

3. Briefly explain the scope of the project.

A discussion about the project was undergone and the team now has a basic understanding of the project.

4. What is the final goal of the project?

To develop an app that can send automatic feedback to the customers by training the review classifier model effectively.

5. What are the different types of reviews?

Reviews are categorized into order reviews and product reviews.
